

Setting A Map

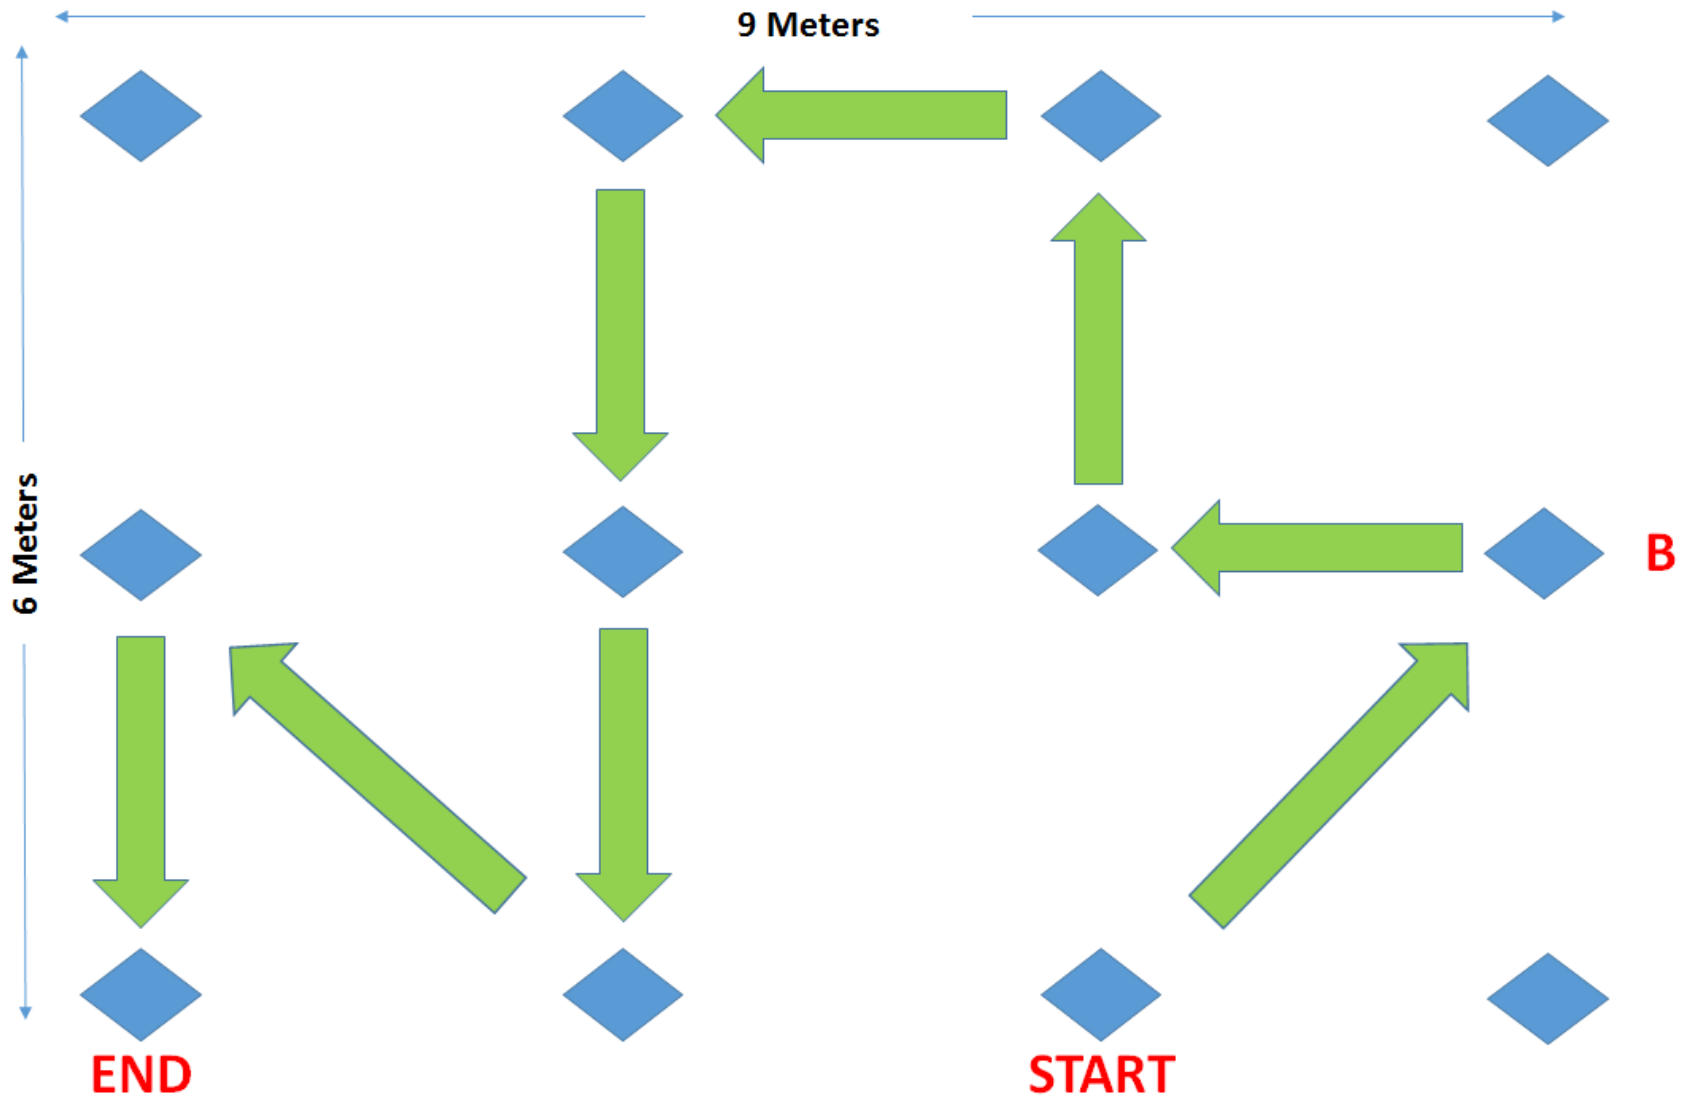

This is short exercise to help you understand what setting you map is all about. Follow the simple steps below.

1. Print out the diagram below. This is your map for this experiment.
2. Replicate the diagram on the ground in your back garden or in a park by using three meter spaces between each of the black circles on the map. To do this, place an object at each blue diamond, three meters apart. Anything will do for this, you will need twelve objects in total.

Note, if you've got a really good imagination, you can try this in your mind's eye but it's more fun to physically do it.

3. Stand at the start on the map and align your map to the ground. You now have your map set.
4. When you are happy with that, follow the route of the green arrowed line in the direction of the arrow. Remember that all the while that you move from one object to the next you need to keep your map set. To do this you need to remember that when you turn your body, the map needs to stay in the same position!
5. When you get to point B, how will your map look as you follow the route? See page three below.
6. When you've followed this the whole way round, draw out another route on the map and follow it again while keeping your map set as you go.

Standing at Point B, keeping your map set, your map should now look like the below in front of you. You have moved so your perspective changes, the map remains in the same position.
